

WARNING!

The combat tips and techniques detailed within this field manual are meant to be used solely against members of the living dead. Executing them against living human opponents would not only be immoral but may be ineffective, as they take advantage of weaknesses and traits exhibited by the undead. Do not use them against friends, colleagues, siblings, or other family members, unless you are absolutely certain that they have turned and have joined the ranks of the undead.

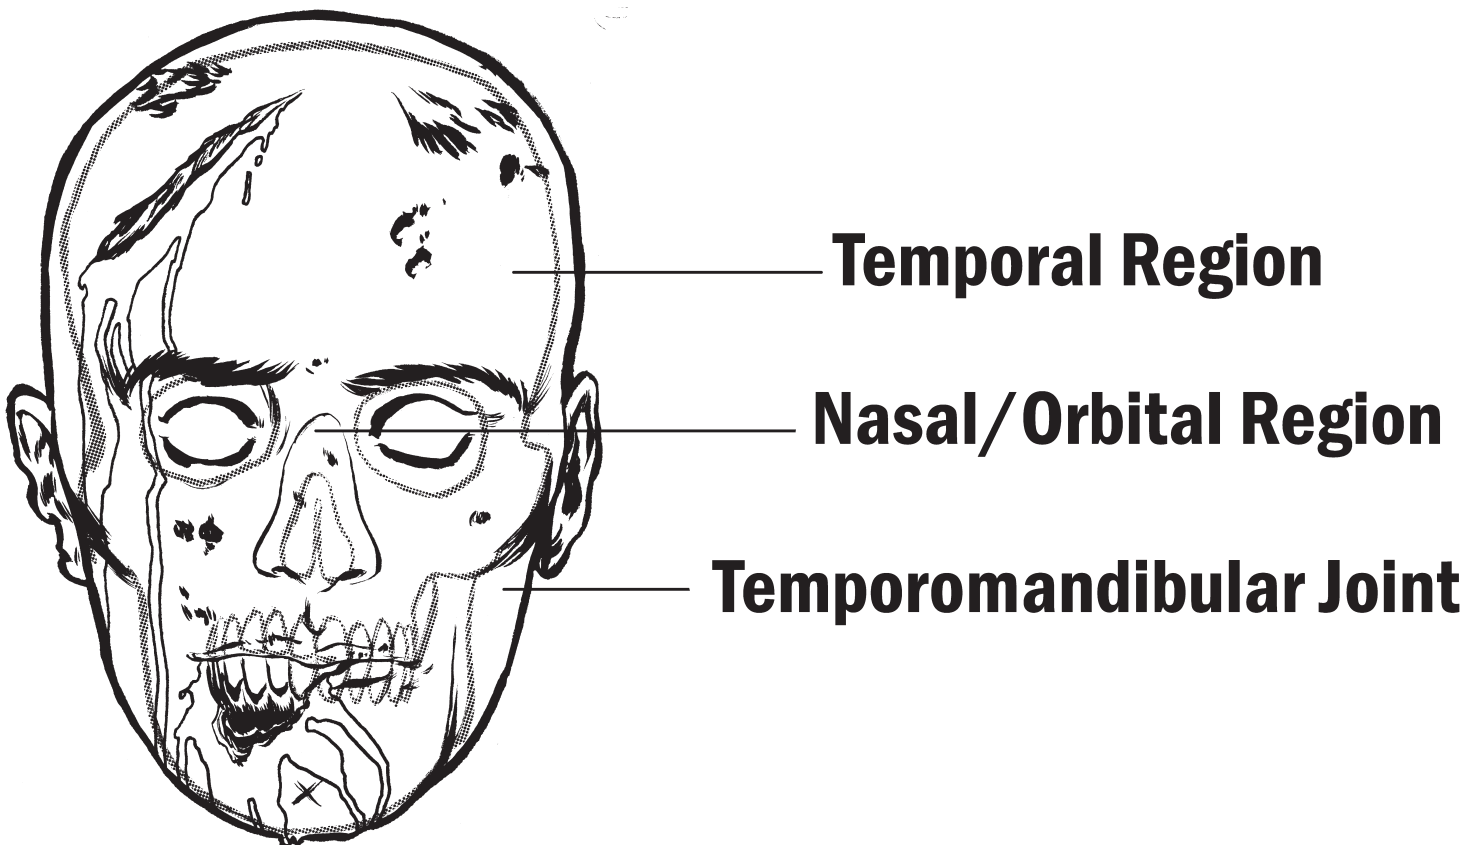

UNDEAD PRIMARY ATTACK: THE MOUTH

The mouth is the zombie's primary means of attack. A hungry ghoul will always look first to pull you into its gaping maw. Your initial defence must be to neutralize this means of attack.

UNDEAD VULNERABILITIES: THE ZOMBIE SKULL

Neutralizing a zombie is more than just “busting its head”. Certain regions of the skull are more vulnerable to compound fracture than others. Study these targets closely; these areas represent the most vulnerable regions of the undead cranium, and are ripe for attack.

PRIMARY ATTACK TARGET: THE ZOMBIE BRAIN

During your offensive attack, it is not enough to simply crack the zombie skull. You must cause a depressive fracture severe enough to penetrate the grey matter, ideally deep into the white matter of the brain. Make your strikes count!
